APPLICATIONS FOR THE PRECISION TRAK & STOP KIT

The Kreg Precision Trak & Stop Kit is designed to provide a new level of accuracy to your woodworking equipment. Whether you are building a new set of support tables for your Miter Saw or replacing the fence on your Radial Arm Saw, the unique design of the Top Trak included in this kit attaches to the fence portion of your setup to provide a calibrated system that will eliminate the need to measure and mark material prior to cutting. These same parts combine with a shop-made Drill Press table to provide a repeatable system that will greatly reduce the time required to layout furniture parts or cabinet components.

The Production Stop provides a “rock-solid” index point to make one cut, or a thousand cuts, exactly the length desired. The unique design of this stop allows the user to simply lift it from one side of the saw blade or boring bit and move it to the other without the fuss of moving it to the end of a fence.

The Swing Stop™ features a “self-elevating” arm that rises over a board to allow for quick trimming of the end without repositioning the stop. This same feature proves invaluable on the Drill Press for multiple stop set-ups.

Each stop has an integral Red-line Cursor that combines with the Self Adhesive Measuring Tapes to provide precise cuts until now only seen on high quality table saws.

Perfect Miter Attachment - KMS7831
This attachment to the Kreg stops references a 45 degree mitered board on two surfaces, greatly increasing the cutting accuracy and repeatability of the mitered cut. Great for picture framing.

Mini Trak - KMS7506
Mini Trak can be used to produce countless types of woodshop jigs and fixtures such as taper jigs, cutoff sleds, and more. Bottom of track accepts a 1/2” wide measuring tape to increase accuracy. Track will capture the head of any 1/4” hex bolt. Sold in a 4’ length with tape. Easily cut to length with a hacksaw.

Trak Clamp - KMS7511
This inexpensive and versatile clamp works great in a variety of applications. Fits the Mini Trak, Top Trak or HD Trak. For most clamping applications, we suggest using two clamps to keep the work piece from rotating.

Precision Band Saw Fence - KMS7200
Introduce a new level of accuracy to your band saw with our Precision Band Saw Fence. We’ve designed this fence with noted band saw expert Mark Duginske to produce an unprecedented level of rigidity, adjustability, and precision. The fence is adjustable in two dimensions for ease in setting it parallel to the blade. Cutting accuracy and repeatability is further enhanced by the precision lens cursor that reads off of the included scale.

Precision Miter Gauge System - KMS7102
Cut perfect miters consistently with the Precision Miter Gauge System. Features factory calibrated accuracy from a gauge head that is machined on a computerized milling machine. A 24” Heavy Duty Trak section with patented Swing Stop™ and self-adhesive measuring tape is included.

**Other Products Available from Kreg.**

**WARNING:** This product contains one or more chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. Wash hands after handling.
1. **Top Trak**

   At the heart of the Precision Trak & Stop Kit is the Kreg Top Trak. Top Trak attaches to your 1/2" thick fence component such as melamine, plywood, or other suitable material. A necessary area on top of the track allows you to attach the Measuring Tape on the Top Trak provides a means to quickly and easily set the Stop Arm. The Half Dowel profile on the front and back of the track anchors the Production Stop. The fence component must be 3/4" x 2-1/4" for the Top Trak, Swing Stop™, and Production Stop to function properly. A groove in the rear of the track functions as a drill guide. Drill a 1/8" screw hole, 1" from each end, then space the remaining screw holes equally between the outside holes for a total of 4 or 5 screw holes per each 2 foot section. To connect the 2 foot Top Trak pieces to form a 4-6, 8, or 8-12 section simply butt the adjoining pieces and mount in place.

2. **Production Stop**

   The Production Stop measures and records the distance between the end of the board and the saw blade, drill bit or router cutter. This allows you to easily cut multiple pieces of stock to the exact same length. Cutting numerous pieces to the exact length without measuring is easy. Gently press the end of the board opposite the blade against the side of the stop arm as shown at left. The Production Stop™ Arm rest on top of the work piece while the board under it is cut. When the board is removed or moved to the side of the Swing Stop™ the Stop Arm drops down and is again ready to be used as a stop.

3. **Swing Stop™**

   The Swing Stop™ measures and records the distance between the end of the board and the saw blade, drill bit or router cutter. This allows you to easily cut multiple pieces of stock to the exact same length. Cutting numerous pieces to the exact length without measuring is easy. Gently press the end of the board opposite the blade against the side of the stop arm as shown at left. The Swing Stop™ Arm rest on top of the work piece while the board under it is cut. When the board is removed or moved to the side of the Swing Stop™ the Stop Arm drops down and is again ready to be used as a stop.

4. **Measuring Tape**

   Locate the Measure Tape
   1. Cut a straight 3/4" thick piece of material exactly 24" long by 3" wide.
   2. Turn the board on edge and place the board with one end against the teeth of the saw blade as shown at left.
   3. Use a square or similar layout tool to place a pencil mark across the top of the fence onto the Top Trak on either side of the indentation for the Self Adhesive Measuring Tape. But the square against the reference board so that the pencil marks will be exactly 24" from the blade as shown. If you have placed Top Trak on both sides of the blade repeat the same process for the other side of the blade.
   4. Align the 24-3/8" mark of the Self Adhesive Measuring Tape to the pencil mark and adhere the Tape to the indentation along the length of the Top Trak. Cutoff excess tape with scissors.

   Note: Placing the Tape is much easier if you slice the backing of the Measuring Tape under the 24" mark and fold over to expose only a short amount of the adhesive.

   Both the Production Stop and the Swing Stop™ feature an adjustable lens cursor similar to the lens on a quality table saw rip fence.

   The lens is a clear material except for a red line (cursor) or bottom of the lens as shown at left. The red line cursor makes it easy to read the tape lines and fine-tune the stop when compensating for blade thickness variations or a tape that is not perfectly positioned.

   Note: When placing the self-adhesive tape onto the track, the tape must be placed 3/8" CLOSER TO THE SAW BLADE to allow the Lens to function properly.

   1. Adjust the cursor so it sits about 3/8" from the edge of the stop. The cursor set screw is on top of the stop arm.
   2. Measure a piece of scrap wood. The exact length of this scrap is not important. A board about 24" works well because it gives you plenty of room to make some test cuts.
   3. Place the scrap on the stop so the cursor is at least a length less than the length of the scrap piece.
   4. Cutoff the scrap to the new length and measure the cut board.
   5. Without moving the stop loosen the cursor set screw and adjust it to read this exact measurement.

### Customized to Your Shop

Four 2 ft. sections of Trak lets you set up your shop for the way you work. Additional Trak sections and extra stops are available separately.

- **8 foot, all on one side**
- **4 foot on either side**
- **6 foot and 2 foot**
